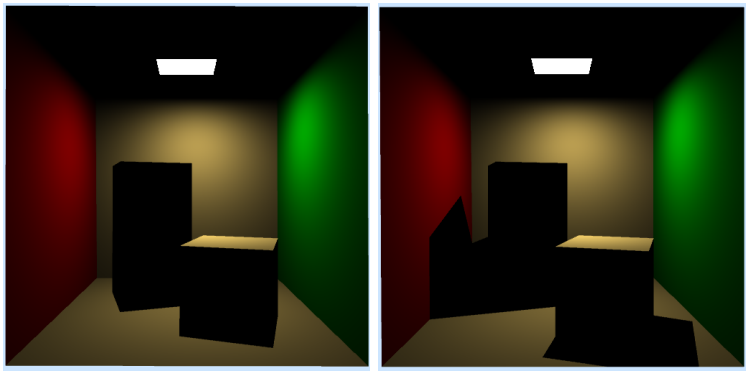
(a) Without shadows: 5s (b) With shadows: 8s

Figure 1: Bunny.obj, Tris: 69451, 36 samples, 1 directional light, Lambertian shader



(a) Without shadows: 0.3s (b) With shadows: 0.5s

Figure 2: Cornellbox.obj and CornellBlocks.obj, Tris: 36, 4 samples, 1 area light, Lambertian shaders

Report Exercise 1

- Implemented a directional light with shadows
- Implemented an area light with shadows

Relevant pictures: figures 1, and 2. Relevant listings: 1, 2, and 3.

Listing 1 : Directional.cpp

```
bool Directional::sample(const Vec3f& pos, Vec3f& dir, Vec3f& L)
    const
{
  dir = -light_dir;
  L = emission;

  // test for shadow
  Ray shadowRay(pos, -light_dir);
  bool inShadow = false;

  if (shadows)
    inShadow = tracer->trace(shadowRay);

  return !inShadow;
}
```

Listing 2 : Lambertian.cpp

```
Vec3f Lambertian::shade(Ray& r, bool emit) const
{
  Vec3f rho_d = get_diffuse(r);
  Vec3f result(0.0f);

  // temp light direction and radiance
  Vec3f lightDirection, radiance;
  for (std::vector<Light*>::const_iterator it = lights.begin(); it
      != lights.end(); it++)
  {
    if ((*it)->sample(r.hit_pos, lightDirection, radiance))
    {
      // output of Lambertian BRDF
      Vec3f f = rho_d * M_1_PIf;

      // directional light radiance
      // f - scattered light radiance, radiance - current light
          radiance, last term: cosine cut off at 0
      result += f * radiance * std::max(dot(r.hit_normal,
          lightDirection), 0.0f);
    }
  }

  return result + Emission::shade(r, emit);
}
```

Listing 3 : AreaLight.cpp

```
bool AreaLight::sample(const Vec3f& pos, Vec3f& dir, Vec3f& L)
    const
{
  // Get geometry info
  const IndexedFaceSet& geometry = mesh->geometry;
  const IndexedFaceSet& normals = mesh->normals;

  // averaged light position
  Vec3f lightPosition = Vec3f(0.0f);
  // averaged normals
  Vec3f lightNormal = Vec3f(0.0f);
  // emission summed up from all faces
  Vec3f emission = Vec3f(0.0f);
```

```
14    // iterate over all faces
      for (int i = 0; i < geometry.no_faces(); i++)
16    {
        // get the center of the face
18      Vec3i face = geometry.face(i);
        Vec3f v0 = geometry.vertex(face[0]);
20      Vec3f v1 = geometry.vertex(face[1]);
        Vec3f v2 = geometry.vertex(face[2]);
22      Vec3f faceCenter = v0 + (v1 - v0 + v2 - v0) * 0.5f;

24      // combine light position
        lightPosition += faceCenter;
26
        // average normals
28      lightNormal += (normals.vertex(face[0]) + normals.vertex(face
            [1]) + normals.vertex(face[2])) / 3;

30      // add emission
        emission += mesh->face_areas[i] * get_emission(i);
32    }

34    // average light position
      lightPosition /= geometry.no_faces();
36
      lightNormal.normalize();
38
      // get light direction and distance to light
40    Vec3f lightDirection = lightPosition - pos;
      float lightDistance = length(lightDirection);
42
      // set area light direction, normalize
44    dir = lightDirection / lightDistance;

46    // set radiance
      L = emission * std::max(dot(-dir, lightNormal), 0.0f) / (
          lightDistance * lightDistance);
48
      // trace for shadows
50    bool inShadow = false;
      if (shadows)
52    {
        Ray shadowRay(pos, dir);
54      shadowRay.tmax = lightDistance - 0.1111f;
        inShadow = tracer->trace(shadowRay);
56    }

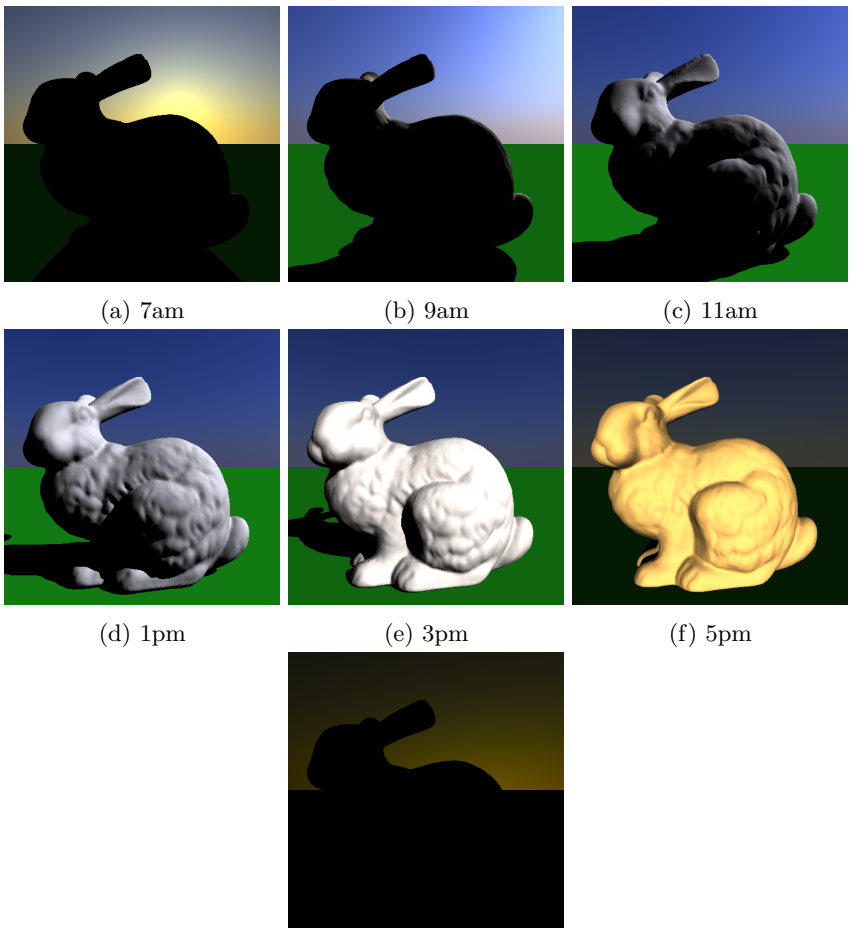
58    return !inShadow;
  }
```

Report Exercise 2

The input parameters for the sun sky light are theta, and phi, together creating the solar position, and the turbidity (how much light is scattered due to dirt in the atmosphere, using empirical values - Preetham). Using Preetham's paper, theta and phi are calculated from the latitude, declination, julian day of the year and the time of the day, as well as some constants from Preetham's paper. The code for this can be found in listing 4.

The model used for calculating the sun's intensity is calculated as shown in listing 5. The sun covers a solid angle of 2π degrees^2 ($\Rightarrow$ the whole hemisphere).

Relevant figure: 3. Relevant listings: 4, and 5.



(a) 7am (b) 9am (c) 11am

(d) 1pm (e) 3pm (f) 5pm

(g) 9pm

Figure 3: Bunny.obj and plane, Tris: 70.000, 1 sample, 1 skylight, Lambertian shaders $\Rightarrow$ approx. 3s per picture

Listing 4 : RenderEngine::init_tracer()

```
if(use_sun_and_sky)
  {
    // Use the Julian date (day_of_year), the solar time (
        time_of_day), the latitude (latitude),
    // and the angle with South (angle_with_south) to find the
        direction toward the sun (sun_dir).

    // hard coded numbers are from Preetham et al.'s A Practical
        Analytical Model for Daylight, SIGGRAPH 1999
    float declination = 0.4093 * sin(2 * M_PIf * (day_of_year - 81)
         / 368);
    float theta = M_PIf * 0.5f - asin(sin(latitude) * sin(
        declination) -
      cos(latitude) * cos(declination) * cos(M_PIf * time_of_day /
          12));
    float phi = atan(-(cos(declination) * sin(M_PIf * time_of_day /
         12)) /
      (cos(latitude) * sin(declination) - sin(latitude) * cos(
          declination) * cos(M_PIf * time_of_day / 12)));

    sun_sky.setSunTheta(theta);
    sun_sky.setSunPhi(phi);
    sun_sky.setTurbidity(turbidity);
    sun_sky.init();
    tracer.set_background(&sun_sky);
  }
```

Listing 5 : PreethamSunSky::sample(..)

```
bool PreethamSunSky::sample(const Vec3f& pos, Vec3f& dir, Vec3f& L)
    const
{
  dir = const_cast<PreethamSunSky*>(this)->getSunDir();

  float area = 1;
  float solid_angle = 2 * M_PI;
  float cos_theta = dot(Vec3f(0, 1, 0), dir);

  // * 0.00001f to convert to the right unit (cd/m^2)
  L = const_cast<PreethamSunSky*>(this)->sunColor() / (area *
      solid_angle * cos_theta) * 0.00001f;

  // test for shadow
  Ray shadowRay(pos, dir);
  bool inShadow = false;

  if (shadows)
    inShadow = tracer->trace(shadowRay);

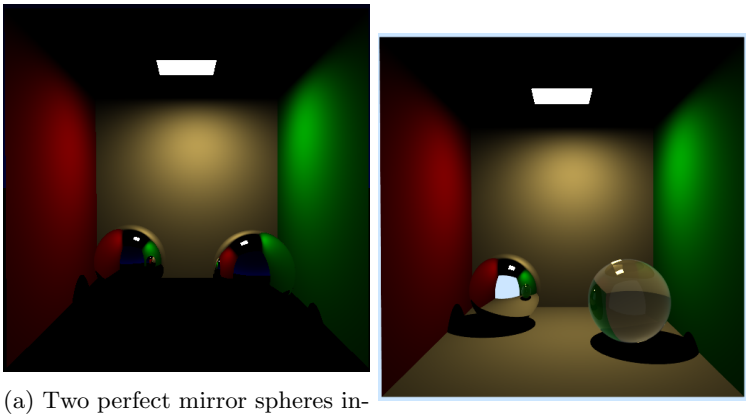
  return !inShadow;
}
```

Report Exercise 3

Implemented:

- Transparent shader
- Mirror shader
- Metal shader
- Russian Roulette
- fresnel equations for dielectric materials and conductors

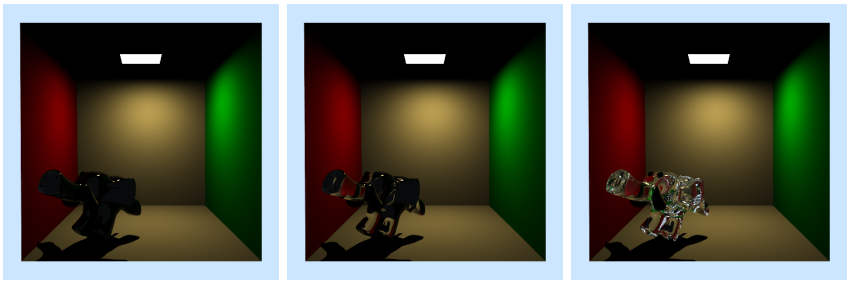
Relevant figures: 4, 5, 6, 7. Relevant listings: 7, and 6.



(a) Two perfect mirror spheres inside of the Cornell Box (using the sunsky lighting).

(b) A mirror and a glass sphere (using default lighting).

Figure 4: Two spheres with different shaders.

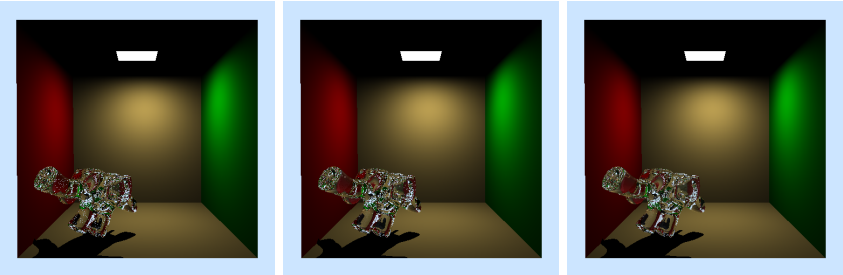


(a) Transparent elephant with cutoff of 1.

(b) Transparent elephant with cutoff of 2.

(c) Transparent elephant with cutoff of 10.

Figure 5: Transparent elephant with different cutoff depths. All pictures used 9 rays per pixel.



(a) Transparent elephant with cutoff of 1, russian roulette.

(b) Transparent elephant with cutoff of 2, russian roulette.

(c) Transparent elephant with cutoff of 10, russian roulette.

Figure 6: Transparent elephant with different cutoff dephts, using russian roulette. 9 rays per pixel

Listing 6 : Transparent::shade

```
Vec3f Transparent::shade(Ray& r, bool emit) const
{
  Vec3f radiance = Vec3f(0.0f);

  if (r.trace_depth < splits)
  {
    radiance = split_shade(r, emit);
  }
  else if (r.trace_depth < max_depth)
  {
    // refraction
    Ray refracted;
    double fresnelR;
    tracer->trace_refracted(r, refracted, fresnelR); // fresnelR =>
        use as step probability

    // russian roulette for reflections
    float rand = randomizer.mt_random();

    // 1st cond. -> russian roulette with fresnelR => pdf, 2nd cond
        . -> eliminating rays following surface
    if (rand <= fresnelR && fresnelR > 0.001)
    {
      // reflect
      Ray reflected;
      tracer->trace_reflected(r, reflected);
      radiance = shade_new_ray(reflected); // * fresnelR / fresnelR
          ; // divide by fresnelR, since fresnelR is used as the
          step probability
    }
    // if not reflecting, take refraction
    else if (1 - fresnelR > 0.001)
    {
      radiance = shade_new_ray(refracted); // * (1 - fresnelR) / (1
          - fresnelR);
    }
  }

  return radiance;
}
```

Listing 7 : Transparent::split_shade

```
Vec3f Transparent::split_shade(Ray& r, bool emit) const
{
  Vec3f radiance(0.0f);

  if (r.trace_depth < splits)
  {
    Ray refracted;
    double fresnelR;
    tracer->trace_refracted(r, refracted, fresnelR);

    if (1 - fresnelR > 0.001)
      radiance += shade_new_ray(refracted) * (1.0f - fresnelR);

    // eliminate rays following the surface
    if (fresnelR > 0.001)
    {
      Ray reflected;
      tracer->trace_reflected(r, reflected);
      radiance += shade_new_ray(reflected) * fresnelR;
    }
  }

  return radiance;
}
```

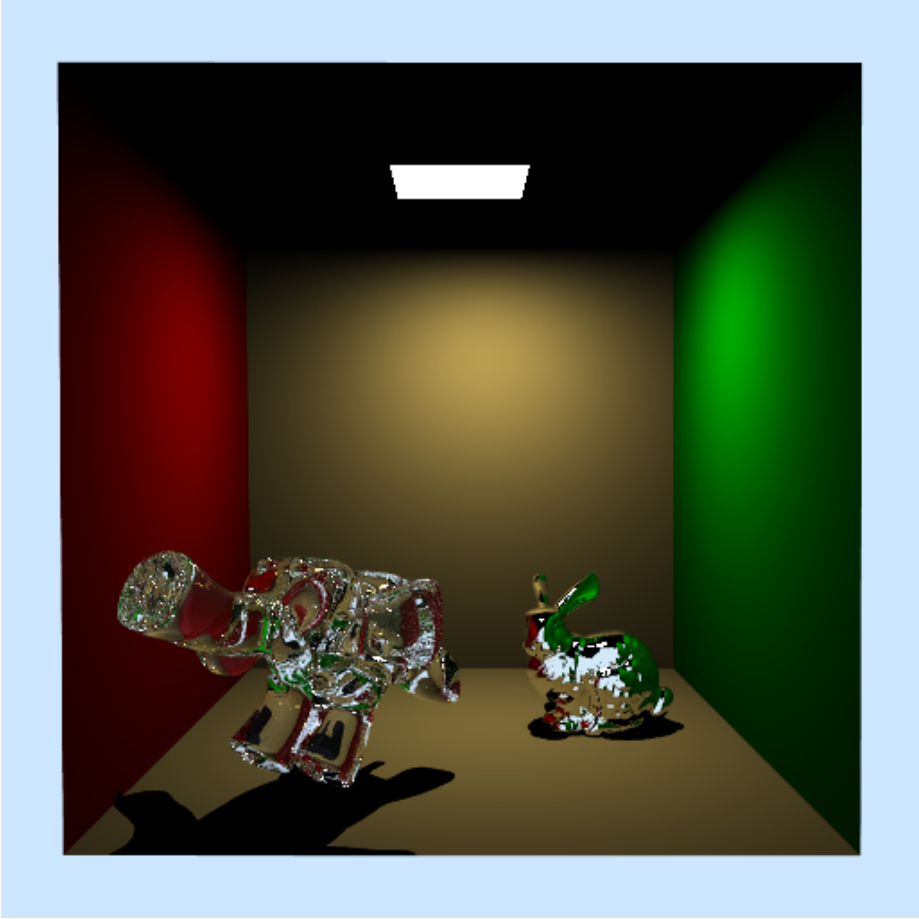


Figure 7: A silver bunny and a transparent elephant, using russian roulette, 9 rays per pixel.
